

4.1 Computing systems and networks – The Internet – Knowledge Organiser

Year 7 Topic number Hyperlink to planning

Key prior learning is highlighted in green, but must be revisited and reinforced during this teaching sequence.

Overview

The Internet

- You should also know that **Information technology (I.T.) includes computers and things that work with computers.**
- You should also know that **information and data can be shared by devices across networks.**
- The internet is a network of networks that is used around the world.
- The World Wide Web is a system on the internet that has websites and webpages.
- Some content is protected on the internet. It is important to know that not all information on the internet is accurate.

The World Wide Web

The World Wide Web

- The World Wide Web is the part of the internet where we can visit web pages and websites.
- Information can be shared in the form of things we can see or hear (e.g. things we can read, music, sounds, or videos, etc.).
- When we use the world wide web, routers help us to journey to different networks in different parts of the world.
- We can use traceroute tools to track the journey between routers.
- Web browsers, e.g. Google Chrome and Internet Explorer, let us look at different pages on the internet.

Website and Webpages

- Websites are a set of webpages.
- Webpages may contain different features, e.g. a title, links to other pages, images, videos, and text.
- Websites and webpages can be found using web addresses (domains), normally split into three parts:
 1. www (world wide web).
 2. Name of the organisation/ topic.
 3. Type of organisation/ location.
- A web address may also be called a URL (Universe Resource Locator). This is the text you type into your internet browser when

Networks and The Internet

-Networks connect different devices to one another, allowing for information sharing.

- Networks can also connect to other networks in different places, using a router.
- The internet is a network of networks that are all connected together.

Router: A router is something that finds a route between networks, connecting them.

The Internet: The internet is a network of networks, that is used around the world to share information and communicate.

Protection: Networks have security features that mean they can block or allow messages and requests. This means that information can be kept

Ownership and Reliability

- The content on the internet may belong to different people or companies, for example the person who wrote it or the company who published it.
- The content may be copyrighted, meaning that others cannot copy or use it without permission.
- Not all of the information that we see or hear on the internet is reliable. Some of it may be inaccurate due to people lying or misunderstanding things.
- Inaccurate information can quickly spread. This has become known as 'fake news.' We should check multiple sources that we can trust to verify information.

Important Vocabulary

Network **Sharing** Router Network Security Network switch Server Wireless access point (WAP) Browser **World Wide Web** Content Links Files Download Sharing Ownership Permission Information
